Executive Summary

In May 2017, the WannaCry ransomware crypto worm caused a global cyberattack, targeting computers running the Microsoft Windows operating system. The ransomware encrypted data on infected systems and demanded ransom payments in Bitcoin to decrypt the files¹. WannaCry exploited a vulnerability known as **EternalBlue**, which was developed by the United States National Security Agency (NSA) and later leaked by a group called The Shadow Brokers.

General Information

- **MD5 Hash:** "db349b97c37d22f5ea1d1841e3c89eb4".
- **SHA256 Hash:**
"24d004a104d4d54034dbcffc2a4b19a11f39008a575aa614ea04703480b1022c".
- **SHA1 Hash:** "e889544aff85ffaf8b0d0da705105dee7c97fe26".
- **File Type:** Executable File.
- **Category:** Crypto Ransomware.

Technical Analysis

Static Analysis

File Analysis

Name	Raw Addr.	Raw size	Virtual Addr.	Virtual Size	Characteristics	Ptr to Reloc.	Num. of Reloc.	Num. of Linenum.
> .text	1000	9000	1000	88CA	60000020	0	0	0
> .rdata	A000	1000	A000	998	40000040	0	0	0
> .data	B000	27000	B000	30489C	C0000040	0	0	0
> .rsrc	32000	35B000	310000	35A454	40000040	0	0	0

After opening the malware with PE-Bear tool, we compared the raw size with virtual size of different sections in the malware file and we found that the malware is not packed.

Offset	Name	Func. Count	Bound?	OriginalFirstThunk	TimeDateStamp	Forwarder	NameRVA	FirstThunk
A1E0	KERNEL32.dll	32	FALSE	A2B0	0	0	A62A	A030
A1F4	ADVAPI32.dll	11	FALSE	A280	0	0	A724	A000
A208	WS2_32.dll	13	FALSE	A3C4	0	0	A732	A144
A21C	MSVCP60.dll	2	FALSE	A334	0	0	A772	A0B4
A230	iphlpapi.dll	2	FALSE	A3FC	0	0	A7A4	A17C
A244	WININET.dll	3	FALSE	A3B4	0	0	A7EC	A134
A258	MSVCRT.dll	28	FALSE	A340	0	0	A8A0	A0C0

- These are the imported libraries and with a simple search we found that **WS2_32.dll**, **iphlpapi.dll** and **WININET.dll** libraries deal with networks.
- The libraries **KERNEL32.dll** and **ADVAPI32.dll** modify the system.

file > tooling	Visual Studio 6.0	3

From PE-Studio tool, the red boxes indicate that there are embedded executable files in different locations and the yellow boxes show a URL and network indicators which may mean that the malware tries to reach this URL:

<http://www.iuqerfsodp9ifjaposdfjhgosurijfaewrwergwea.com>.

file-version	6.1.7601.17514 (win7sp1_rtm.101119-1850)
description	Microsoft® Disk Defragmenter

- The entropy of this malware is high which indicates that the malware uses some kind of encryption and encoding.
- So before we continue our analysis, we need to put in mind these few findings:
 - The malware is not packed.
 - There are codes embedded in different locations from the main code.
 - The malware uses some sort of encryption or encoding.
 - The malware tries to reach a specific URL and uses network APIs.

Code Analysis

```

mov     ecx, 0Fh
mov     esi, offset aHttpWwIuqerfs ; "http://www.iuqerfsodp9ifjaposdfjhgosuri..."
lea     edi, [esp+58h+szUrl]
xor     eax, eax
rep movsd
movsb
mov     [esp+58h+var_17], eax
mov     [esp+58h+var_13], eax
mov     [esp+58h+var_F], eax
mov     [esp+58h+var_8], eax
mov     [esp+58h+var_7], eax
mov     [esp+58h+var_3], ax
push    eax                ; dwFlags
push    eax                ; lpszProxyBypass
push    eax                ; lpszProxy
push    1                  ; dwAccessType
push    eax                ; lpszAgent
mov     [esp+6Ch+var_1], al
call    ds:InternetOpenA
push    0                  ; dwContext
push    8400000h           ; dwFlags
push    0                  ; dwHeadersLength
lea     ecx, [esp+64h+szUrl]
mov     esi, eax
push    0                  ; lpszHeaders
push    ecx                ; lpszUrl
push    esi                ; hInternet
call    ds:InternetOpenUrlA
mov     edi, eax
push    esi                ; hInternet
mov     esi, ds:InternetCloseHandle
test    edi, edi
jnz     short loc_4081BC

```

From main function, the malware tries to open the URL:

<http://www.iuqerfsodp9ifjaposdfjhgosurijfaewrwergwea.com>

using “InternetOpenUrlA” function, stores the return value from “eax” register into “edi” register and uses the “test” instruction to compare if the result is zero or not.

```
call    ds:InternetOpenUrlA
mov     edi, eax
push    esi                ; hInternet
mov     esi, ds:InternetCloseHandle
test    edi, edi
jnz     short loc_4081BC

call    esi ; InternetCloseHandle
push    0                  ; hInternet
call    esi ; InternetCloseHandle
call    sub_408090
pop     edi
xor     eax, eax
pop     esi
add     esp, 50h
retn    10h

loc_4081BC:
call    esi ; InternetCloseHandle
push    edi                ; hInternet
call    esi ; InternetCloseHandle
pop     edi
xor     eax, eax
pop     esi
add     esp, 50h
retn    10h
_WinMain@16 endp
```

- If the return value is true (the URL opens successfully) , the malware will execute the true branch and terminates the program otherwise, the malware will execute the false branch and call the function “sub_408090” which we will analyze later in this report.
- The URL is random and doesn't exist which means that the malware will be executed every time the URL is unreachable.

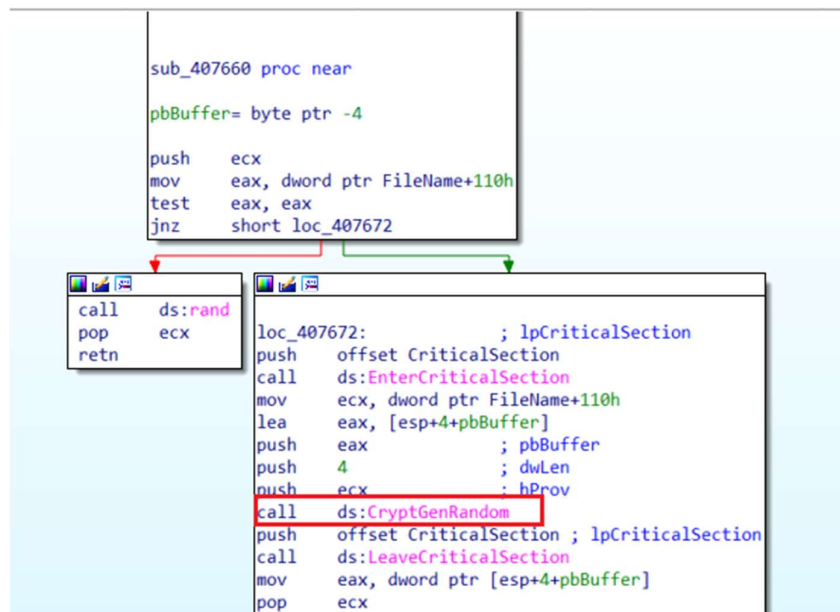

```
sub_408090 proc near

ServiceStartTable= SERVICE_TABLE_ENTRYA ptr -10h
var_8= dword ptr -8
var_4= dword ptr -4

sub     esp, 10h
push    104h                ; nSize
push    offset FileName      ; lpFilename
push    0                   ; hModule
call    ds:GetModuleFileNameA
call    ds:__p__argc
cmp     dword ptr [eax], 2
jge     short loc_4080B9
```

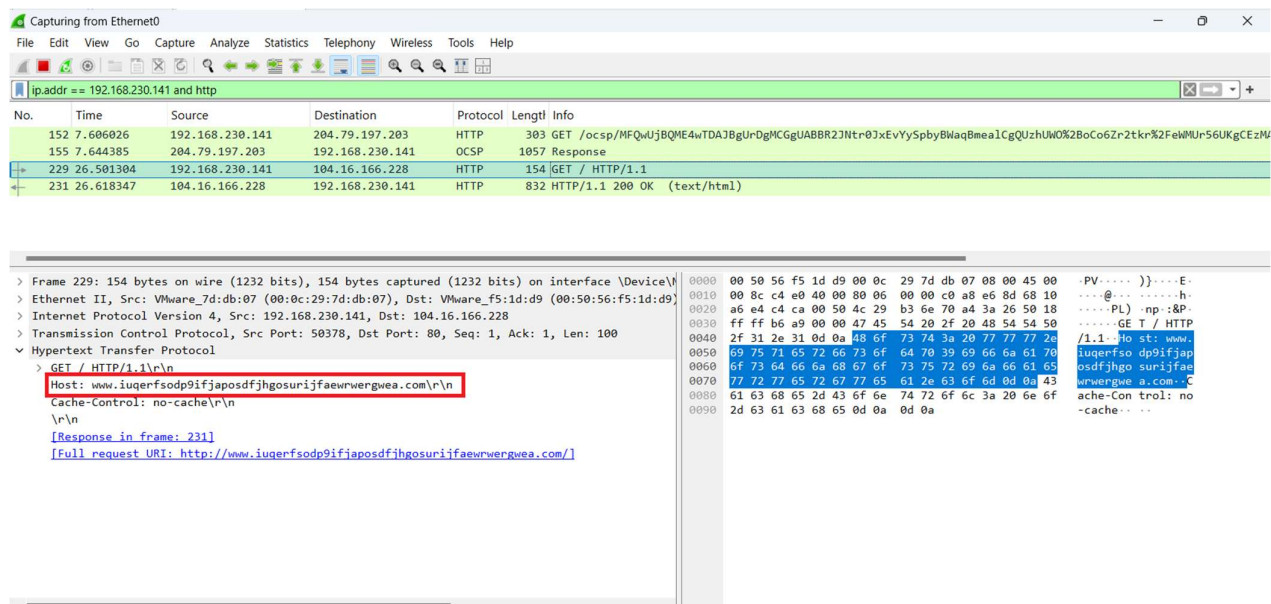

After going into the “sub_408090” function, I didn't understand what it is doing but it didn't go to the malicious code. So I will modify the flags in order to go to the malicious code.

Encryption

This part of the malware may be the code responsible for the encryption part as it takes a handle of the real encryption code.

Dynamic Analysis

- In the above image, the packets captured after running the malware and we found that the malware tried to connect to the following URL:
www.iuqerfsodp9ifjaposdfjhgosurijfaewrwergwea.com.
- The malware uses this URL as a condition to check it will execute the ransomware code or not.

```

push 0 ; dwHeadersLength
lea ecx, [esp+64h+szUrl]
mov esi, eax
push 0 ; lpszHeaders
push ecx ; lpszUrl
push esi ; hInternet
call ds:InternetOpenUrlA
mov edi, eax
push esi ; hInternet
mov esi, ds:InternetCloseHandle
test edi, edi
jnz short loc_40818C

call esi ; InternetCloseHandle
push 0 ; hInternet
call esi ; InternetCloseHandle
call sub_408090
pop edi
xor eax, eax
pop esi
add esp, 50h
retn 10h

loc_40818C:
call esi ; InternetCloseHandle
push edi ; hInternet
call esi ; InternetCloseHandle
pop edi
xor eax, eax
pop esi
add esp, 50h
retn 10h
_WinMain@16 endp

```

80.00% (-232,881) (983,428) 000081AD 004081AD: WinMain(x,x,x,x)+6D (Synchronized with Hex View-1)

I set a breakpoint at the “jnz” instruction in order to control the execution flow of this ransomware and I changed the zero flag from 0 to 1 to go to the left block of code and get into the “sub_408090” function.

```

.text:0040809D push 0 ; hModule
.text:0040809F call ds:GetModuleFileNameA
.text:004080A5 call ds:___p__argc
.text:004080AB cmp dword ptr [eax], 2
.text:004080AE jge short loc_4080B9

.text:004080B0 call sub_407F20
.text:004080B5 add esp, 10h
.text:004080B8 retn

.text:004080B9 loc_4080B9:
.text:004080B9 push edi
.text:004080BA push 0F003Fh ; dwDesiredAccess
.text:004080BF push 0 ; lpDatabaseName
.text:004080C1 push 0 ; lpMachineName
.text:004080C3 call ds:OpenSCManagerA
.text:004080C9 mov edi, eax
.text:004080CB test edi, edi
.text:004080CD iz short loc_408101

```

80.00% (-213,255) (1016,283) 000080AE 004080AE: sub_408090+1E (Synchronized with EIP)

After getting into “sub_408090” function, I changed the sign flag from 1 to 0 in order to go to the right block of code.

```

.text:00408101 loc_408101:
.text:00408101 lea eax, [esp+14h+ServiceStartTable]
.text:00408105 mov [esp+14h+ServiceStartTable.lpServiceName], offset ServiceName ; "mssecsvc2.0"
.text:0040810D push eax ; lpServiceStartTable
.text:0040810E mov [esp+18h+ServiceStartTable.lpServiceProc], offset loc_408000
.text:00408116 mov [esp+18h+var_8], 0
.text:0040811F mov [esp+18h+var_4], 0
.text:00408126 call ds:StartServiceCtrlDispatcherA
.text:0040812C pop edi
.text:0040812D add esp, 10h
.text:00408130 retn
.text:00408130 sub_408090 endp

```

The ransomware here begins to execute its code in a new service with a name “mssecsvc2.0” and encrypts all the data on the machine.

Behavioral Analysis

- After running the malware in our controlled environment with administrator privileges, I found a few files are created in desktop and this image is from “@WanaDecryptor@.exe” file.
- This malware has encrypted all of my files in this machine.

- In the above image, we observe the difference before and after running the malware. The existing files are encrypted by the ransomware and the yellow box is the “@WanaDecryptor@.exe” file that we discussed before and original files are deleted from the machine.
- Each encrypted file has a file extension “.WNCRY” and it is added after the original file name like “FILE_NAME.pdf.WNCRY”.

Dependencies

- **DLLs Imported into the Ransomware:**
 - KERNEL32.dll.
 - ADVAPI32.dll.
 - WS2_32.dll.
 - MSVCP60.dll.
 - iphlpapi.dll.
 - WININET.dll.
 - MSVCRT.dll.

Indicators of Compromise (IoCs)

- **URL:** “http://www.iuqerfsodp9ifjaposdfjhgosurijfaewrwergrwa.com”.
- **Extension File:** “.WNCRY”.
- **Executable File:** “@WanaDecryptor@.exe”.
- **Executable File:** “mssecsvc.exe”.
- **File:** “@Please_Read_Me@.txt”.
- **Executable File:** “tasksche.exe”.
